### Discussion

During a meeting held on Wednesday morning, 9/10/03, Duane Parsons (RISS) and Mike Flannery (RISS) discussed the preliminary reconnaissance level characterization (RLC) survey results for Building 668 with David Kruchek (CDPHE). A walkdown of B668 was also conducted during the meeting.

RLC radiological survey results were all less than the unrestricted release criteria, except for one area on the concrete floor that is still being investigated. The highest elevated spot on the floor was approximately 160 dpm/100cm<sup>2</sup> with an Electra, no loose contamination was found. Since the elevated spot was in an area where rusty metal drums and pallets once stood, it is suspected that the contamination is naturally occurring polonium 210 activity. A concrete sample of the highest elevated spot on the floor was collected, but the isotopic results are not yet back from the laboratory.

Beryllium smears have also been collected inside B668, all results were <0.1 ug/100cm<sup>2</sup>. Based on the RLC radiological and beryllium survey results of the walls and ceiling, and the numerous large openings presently in the building (due to building deterioration), it was determined that it would be acceptable to complete the removal of the transite wall paneling prior to the completion for the RLC report.

The transite wall paneling work will be performed using an approved B668 asbestos abatement permit and workers will be in appropriate PPE.

Duane Parsons will inform David Kruchek and Mike Flannery of the concrete sample results as soon they are known.
